

Wall Panel Tips & Techniques

Courtyard
Collection™

It is recommended that Courtyard wall panels be built with a mixture of Dublin and York blocks to create random patterns. The panels can also be built using just one of the blocks if preferred.

When laying out a wall always start by building the first two courses at the same time. This will ensure that additional courses will line up properly.

Dublins are designed to work on a quarter bond. This means that the block above and below will overlap by 1/4 of the block.

Dublin blocks are angled to the left, and to the right.

Angle left with raised rings up

Comes in center and end-split.

Angle right with raised rings up

Comes in center-split.

There are 2 courses of angled left blocks for each course of angled right blocks on each pallet. Raised rings must be facing up to determine left and right direction.

Dublin
Angled left

Dublin
Angled right

Within a pallet you will find twice as many angled left blocks as angled right blocks. If you intend to build with only the Dublin units, you will need to vary the blocks used per course to fully use all the blocks on your pallet. Use 2 courses of angled left block for each course of angled right blocks used. *See graphic above.*

Another technique which will allow you to mix the two Dublin shapes, is to turn a block upside-down to achieve the correct direction. This should not be done more than 20% of the time.

The transition between the angled left and right Dublin blocks is created by placing a York between the two Dublins. Your wall design can be more flexible when both the York and Dublin blocks are used.

Building with both York and Dublin blocks provides the most flexibility and versatility in your project.
